ABSTRACT: P. I. VOYEVODIN died on 25 November 1964; one of the oldest Bolshevik-Leninists, he was a member of the CPSU already in 1899. He fought in the early battles of the revolution, was imprisoned and sent to Siberia in 1905. After the October Revolution he became an economic adviser to Lenin on matters pertaining to Siberia and the entire Soviet Union as well. He was active in planning and organizing GOELRO. In 1921 he was assigned to set up the new Russian cinema industry, later he turned to the problems of electrification: spreading Lenin's ideas, publishing books and periodicals on the subject. He was the first Soviet editor of "Elektrichestvo" and then the editor of "Elektrifikatsiya." He partici-

TITLE: Honoring the 60th birthday of Aleksandr Dmitriyevich Romanov

SOURCE: Elektricheskiye stantsii, no. 11, 1965, 94

TOPIC TAGS: electric power plant, industrial personnel

ABSTRACT: In July 1965 A. D. Romanov celebrated his 60th birthday and the 35th anniversary of his active life as a major designer, operator, and builder of electric power stations. On his graduation in 1927 from the Moscow College of Engineering, Aleksandr Dmitriyevich joined the Mosenergo Moscow Power System where he steadily rose through the ranks until he became Deputy Chief Engineer, while at the same time participating in the design and practical introduction of 500-kV electric transmission lines running from Moscow to Volzhskaya Hydroelectric Power Station and from Kuybyshev to the Urals. Since 1959 A. D. Romanov has been Chief Engineer at the Glavvostokelektroset'-stroy Main Administration for Power Grid Construction in Eastern USSR of the

State Production Committee for Energetics and Electrification USSR. Along with his active work, since 1930 A. D. Romanov has been teaching courses in Power Networks and Systems as well as in Power Stations and Substations at the Moscow Correspondence Institute of Energetics and, later, at the All-Union Correspondence Institute of Energetics, and, in this capacity, has trained new cadres of power engineers. In 1957 the title of Assistant Professor was conferred on him and in 1963, the title of Candidate of Technical Sciences. He has published more than 40 scientific and technical articles on power engineering and construction and he is a member of the editorial boards of the periodic anthologies Energeticheskoye Stroitel'stvo (Power Construction) and Energeticheskoye Stroitel'stvo za Rubezhom (Power Construction Abroad). He has been a Party member since 1932 and is the bearer of the Order of Labor Red Banner as well as of various medals. Best wishes for further creative work are extended to him. SERBINOVSKIY, A.I.

AUTHOR: Serbinovskiy, A.I., Engineer 91-58-7-17/27

TITLE: Exchange of Experience (Obmen opytom). A Simple Remote-Measuring System (Prostaya sistema distantsionnogo izmereniya).

PERIODICAL: Energetik, 1958, Nr 7, p 32 (USSR)

ABSTRACT: The described system, comprising pickups, a line and a secondary instrument, can be utilized for measuring loads on electric motors operating at artesian wells (Figure 1). Toroidal transformers, the secondary winding of which gives a voltage proportional to the current of the primary winding, are used as pickups. The line has only one conductor, the earth being the second. An output meter of the "IV-4" type is used as secondary instrument. This system guarantees a measuring accuracy of 3 % at a maximum distance of 4 km from objects being measured. There are 2 figures and 1 circuit diagram.

On electrical energy losses arising from inaccuracy of
domestic consumers' power meters. SEMENOVSKI, G. V.
AND IOKHVIDOV, E. S. Elektrichesvo (No. 1) 32-3
(1948) In Russian. Curves are given of the errors
of the Russian Class 2 Standard 5 A Wh-meter. The
effect of these errors on the total power metered is
discussed for cases when the meters are used without
instrument transformers. It has been found that very
frequently these systems operate with under-voltage and
over-current. By use of a typical load curve of an average
domestic consumer, a nominal value is determined for the
terminal e.m.f. of a meter on the system. An expression is deduced for the average
figures, and the error curves gives, a value for the
monthly power loss is calculated for the whole system.

867. Experience in the application of transformer
substation units of the Moscow Transformer Works
E. S. IOKHNOV AND G. B. SERBINOVSKI. Elekt.
Stantsii, 1953, No. 8, 35-8. In Russian.

Experience with steel-clad 10/0-230 kV substation
units with two transformers of 180-560 kVA each
in the Moscow power supply system led to some
suggestions for improvement such as: increasing the
number of isolators on the h.v. side so as to permit
the disconnection of in- and outgoing feeder cables;
use of a.c.-operated contactors instead of d.c. battery-
operated switchgear on the l.v. side, which has already
shown improved reliability at less cost in the case of
400 substations; arrangement so as to permit separate
access by staff of supply authority to transformer and
main contactors and by staff of consumer to other
l.v. switchgear.

Electrical Engineering Abstracts
May 1954
Distribution

1943. Introduction of h.v. into town centres. E. S.
JOKHVIDOV AND G. V. SERBINOVSKIY. *Elektrichesvo*,
1953, No. 9, 3-9. In Russian.

In a book by Shteingauz (*Problems of Electricity
Supply in Town-Planning*, Moscow, 1952) it is stated
that transmission lines at voltages >35 kV could be
kept outside towns, except in the case of the largest
cities. The authors attempt to show that this problem
depends above all on the load density, diversity
factors, character of the sources of supply, etc., and,
on the other hand, the character of the urban districts,
industrialization, public transport undertakings, etc.
The erection of regional substations with 110 kV
primary voltage is rational for a necessary rating
30 MVA. Under present demand conditions for
urban areas built-up with multiple-storied buildings
this means that such a substation is at present required
for every 3-8 km² area, and at a future development
stage one may be required for every km².

Submitted : Apr 21, 1955

SOV/112-57-5-10147

Present State and Fundamental Problems in Electric Power Supply to Industrial . . .

line without a large step-down station is sometimes economical. At present, the principal trends of development of industrial power supply are: (1) a deep high-voltage entrance into departments with decentralized transformer substations; (2) maximum automation and dispatcher's control; (3) use of packaged transformer substations; (4) distribution of power by busways. To make electric installation more economical, the power factor should be further raised by installation of capacitors, by better loading of motors and transformers, by better utilization of synchronous motors. The synchronous motors should be equipped with forced excitation that ensures the stability of the synchronous motors proper and, consequently, the stability of the entire power system during voltage dips.

AUTHOR: Serdyukov, I. V.

TITLE: High-sensitivity air-pressure stabilizer

SOURCE: Priborostroyeniye, no. 6, 1964, 21-22

TOPIC/TAGS: air pressure stabilizer, sensitive air pressure stabilizer

ABSTRACT: The stabilizer includes (see Enclosure 1) metal or plexiglas chamber 1 closed by brass lid 2 with gasket 3. A hole in the lid is calibrated to hold ball 4. Cone weight 5 and damping disk 6 are suspended from the ball. Projection 7 is used to position the stabilizer vertically in a holder. The weight-holding rod passes loosely in plexiglas diaphragm 11 above which two nipples 12 and 13 with capillary tubes are mounted. Air at 1.2-1.4 kg/cm² is admitted through 13 and discharged through 12 and around the ball, which floats in the air flow. The chamber pressure is given by: $P = \frac{G - F}{S}$, where G is the ball, cone,

Card 1/3

ACCESSION NR: AP4041339

and disk combined weight, F is the buoyancy force of the liquid, S is the diameter-section area of the ball. An error of stabilization about 0.05% is claimed. Orig. art. has: 1 figure.

AUTHOR: Morozov, M. D.; Brodovoy, V. V.; Sedyukov, M. E.; Tukarevskiy, V. A.

TITLE: Geophysical research in Kazakhstan and its main results

SOURCE: Ref. zh. Geofizika, Abs. 12D98

REF SOURCE: Sb. Vopr. geol. Kazakhstana. Alma-Ata, Nauka, 1964, 196-219

TOPIC TAGS: geophysics, seismic prospecting, gravimetric prospecting, oil prospecting,
CARTH CRUST

ABSTRACT: Geophysical methods were started in Kazakhstan in 1925, and are now indispensable in all stages of geological research. In 1964 there were in Kazakhstan 100 seismic prospecting, 90 gravimetric, 210 electro-recon, 3 aeromagnetic, 150 ground level magnetic and 150 metainometric teams. The paper discusses geophysical research of the regional earth crust structure in depth, oil prospecting and preparations for oil drilling, search for useful minerals and geological mapping. The work is illustrated by a schematic geophysical map of Kazakhstan with examples of geophysical methods. Basic directions for further development are suggested. The need for a wider introduction of EDP in the evaluation and interpretation of geophysical data is argued and the importance of standard operational software adapted to definite types of geologic and geophysical conditions is noted.
